

LUBEKAT®

Normally, high-speed rubbing of the metal against the oil strip the metal's atoms electrons to the oil.

But high alkaline material has the ability to force back electrons that are scraped from the metal's atoms.

The metal's ions dissolve into the oil.
But the metal's atoms don't dissolve into the oil.

Because LUBEKAT has high alkaline properties, machinery doesn't wear down.

The durability of machinery becomes very high.
